Lo-Fi SES: you've been practicing to play this chiptune instrument your whole life

Know how to play video games? Like music? You'll love the Lo-Fi SES (Sound Entertainment System). It's an instrument that makes it easy to rock out as a chiptune artist.

The Lo-Fi SES is all fun with no practice. It may look like a game controller, but it's actually a *music* controller. You might've never learned to play piano or guitar, but I'll bet you rocked at more than a few video games. Lo-Fi SES lets you turn those hard fought skills into musical magic.

A combination of things make this instrument unique. It is a fully open (hardware and software) audio platform, compatible with the Arduino ecosystem, and uses an innovative cart-based expansion system. Yay cartridges!!! The "higher-level" users can hack on the software via a "USB: a Link to the Hack" cart or even design a custom cart themselves. (I would love to see someone create a ridiculous rumble pack.) Also, the USB cart solves a common complaint for other lo-fi instruments: it allows you to swap out the sounds with ones of your own design.

The Lo-Fi SES lets you level up your music skills and look good while doing it. Join the adventure and we can rock out together!
